

Water reuse across the university

The University strategies to minimize water losses are:

1. Chose native plants that require little or no additional irrigation;
2. Reduce planting density and turf grass area;
3. Use drip irrigation during early morning or late afternoon hours to minimize evaporative loss;
4. Maximize on-site wetland system to recycle grey water, use recycled grey water for flushing and irrigation; and
5. Minimize landscape area as much as possible and increase other paved area in lieu of soft landscape area
